2. Open a File
3. Map Columns
4. TradeName Settings
5. Build Output
6. Preview Changes
7. Fix Descriptions
8. Save Settings
9. Write to Database

Shortening Rules

SPECIALS

Typical Workflow

1. Select Brand
2. Import File
3. Column Mapping
4. Review the Grid
5. Editing & Cleaning
6. Special Name & Dates
7. Save to Database

Price File App

User Guide — for pharmacy staff

Overview

The **Price File App** is a desktop tool for importing price files received from suppliers and loading them into the RxOne database. It has two main areas:

- **Price File** — import regular price files (cost, retail, barcodes) from suppliers.
- **Specials File** — import promotional or catalogue specials sent by brands.

Both modules read from CSV or Excel files, let you review and clean the data, and then write it directly into the database.

Starting the App

Double-click **PriceFileApp.exe** in the application folder. The window will open and connect to the database automatically. You will see two tabs at the top — **Price File** and **Specials File**.

□ The first launch may take 3-5 seconds while the app loads. This is normal.

Price File Module

Import regular supplier price files — costs, retail prices, barcodes, descriptions — into the RxOne database.

Typical Workflow

Each time you receive a new price file from a supplier, follow these steps in order:

-  **Select Supplier**
Choose the supplier from the dropdown. The app quietly fetches their current data in the background.
-  **Open File**
Browse to the CSV or Excel file the supplier sent.
-  **Choose a Template & Map Columns**
Select the appropriate template (or leave on General) and check column mappings.
-  **Set TradeName Options**
Configure how the product description will be built from the file's columns.
-  **Build Output**
Click *Build Output* to process the file and create the cleaned data set.
-  **Preview Changes**
Click *Preview Changes* to compare the new data against what is already in the database.
